gives

\[ f(x) = \frac{x^3}{x^2 + 1} = x - \frac{x}{x^2 + 1} \]

This equation suggests that \( y = x \) is a candidate for a slant asymptote. In fact,

\[ f(x) - x = -\frac{x}{x^2 + 1} = -\frac{x}{1 + \frac{1}{x^2}} \to 0 \quad \text{as} \quad x \to \pm \infty \]

So the line \( y = x \) is a slant asymptote.

E. \[ f'(x) = \frac{(x^2 + 1)(3x^2) - x^3 \cdot 2x}{(x^2 + 1)^2} = \frac{x^2(x^2 + 3)}{(x^2 + 1)^2} \]

Since \( f'(x) > 0 \) for all \( x \) (except 0), \( f \) is increasing on \((-\infty, \infty)\).

F. Although \( f'(0) = 0 \), \( f' \) does not change sign at 0, so there is no local maximum or minimum.

G. \[ f''(x) = \frac{(x^2 + 1)^2(4x^4 + 6x) - (x^4 + 3x^2) \cdot 2(x^2 + 1)2x}{(x^2 + 1)^3} = \frac{2x(3 - x^2)}{(x^2 + 1)^3} \]

Since \( f''(x) = 0 \) when \( x = 0 \) or \( x = \pm \sqrt{3} \), we set up the following chart:

<table>
<thead>
<tr>
<th>Interval</th>
<th>( x )</th>
<th>( 3 - x^2 )</th>
<th>( (x^2 + 1)^3 )</th>
<th>( f''(x) )</th>

The points of inflection are \((-\sqrt{3}, -\frac{3}{4}\sqrt{3})\), \((0, 0)\), and \((\sqrt{3}, \frac{3}{4}\sqrt{3})\).

74. Let \( f(x) = (x^3 + 1)/x \). Show that
\[
\lim_{x \to \pm \infty} [f(x) - x^2] = 0
\]
This shows that the graph of \( f \) approaches the graph of \( y = x^2 \), and we say that the curve \( y = f(x) \) is asymptotic to the parabola \( y = x^2 \). Use this fact to help sketch the graph of \( f \).

75. Discuss the asymptotic behavior of \( f(x) = (x^4 + 1)/x \) in the same manner as in Exercise 74. Then use your results to help sketch the graph of \( f \).

76. Use the asymptotic behavior of \( f(x) = \sin x + e^{-x} \) to sketch its graph without going through the curve-sketching procedure of this section.

### 4.6 Graphing with Calculus and Calculators

You may want to read “Graphing Calculators and Computers” at www.stewartcalculus.com if you haven’t already. In particular, it explains how to avoid some of the pitfalls of graphing devices by choosing appropriate viewing rectangles.

The method we used to sketch curves in the preceding section was a culmination of much of our study of differential calculus. The graph was the final object that we produced. In this section our point of view is completely different. Here we start with a graph produced by a graphing calculator or computer and then we refine it. We use calculus to make sure that we reveal all the important aspects of the curve. And with the use of graphing devices we can tackle curves that would be far too complicated to consider without technology. The theme is the interaction between calculus and calculators.

**EXAMPLE 1** Graph the polynomial \( f(x) = 2x^6 + 3x^5 + 3x^3 - 2x^2 \). Use the graphs of \( f' \) and \( f'' \) to estimate all maximum and minimum points and intervals of concavity.

**SOLUTION** If we specify a domain but not a range, many graphing devices will deduce a suitable range from the values computed. Figure 1 shows the plot from one such device if we specify that \(-5 \leq x \leq 5\). Although this viewing rectangle is useful for showing that the asymptotic behavior (or end behavior) is the same as for \( y = 2x^6 \), it is obviously hiding some finer detail. So we change to the viewing rectangle \([-3, 2] \) by \([-50, 100] \) shown in Figure 2.
